How Have Per Capita CO_2 Emissions Changed Across Countries?

A Data Visualization Study

Project Summary

Carbon dioxide (CO_2) emissions are a major driver of climate change, but emissions per person vary widely across countries. This project will use country-level data to explore how per capita CO_2 emissions have changed over time and how countries compare in recent years.

Data Source

Our World in Data, based on the Global Carbon Budget (2025) and population data from various sources (2024). The indicator measures territorial CO_2 emissions from fossil fuels and industrial processes in tonnes per person. The set covers 1750–2024.

Data Name: CO_2 emissions per capita
